«Wavefront and Dispersion Control with Functional Electromagnetic Metasurfaces»

Δρ. Οδυσσέας Τσιλιπάκος

Ινστιτούτο Ηλεκτρονικής Δομής και Λέιζερ, Ιδρυμα Τεχνολογίας και Έρευνας, Κρήτη

Metasurfaces are ultra-thin, two dimensional versions of metamaterials. In this talk, I will cover the possibilities offered by electromagnetic metasurfaces for performing elaborate functions which up to now have been realized with bulky, three-dimensional structures such as lenses, gratings, optical cavities and delay lines. Such advanced functionalities are made possible by *spatially* and *spectrally* tailoring the phase discontinuity imposed by the metasurface on the impinging wave. In the first part of the talk I will focus on metasurfaces for reconfigurable wavefront manipulation. I will show two examples: all-dielectric metasurfaces made of dielectric particles supporting toroidal- and magnetic-dipole Mie resonances [1], and metallic patch metasurfaces with integrated tunable elements offering complete local control over the complex surface impedance [2]. In the second part, I will discuss multi-resonant metasurfaces for dispersion control with an emphasis on broadband time delay [3]. The proposed metasurfaces are of deeply subwavelength thickness, thus exhibiting significant technological advantages over conventional diffractive and dispersive optical elements, respectively.
